CRYSTALLOGRAPHY

Protein Data Bank

A repository system for protein crystallographic data will be operated jointly by the Crystallographic Data Centre, Cambridge, and the Brookhaven National Laboratory. The system will be responsible for storing atomic coordinates, structure factors and electron density maps and will make these data available on request. Distribution will be on magnetic tape in machine-readable form whenever possible. There will be no charge for the service other than handling costs. Files will be updated as new material is received. The total holding will be announced annually in the organic bibliographic volumes of the reference series "Molecular Structures and Dimensions" published for the Crystallographic Data Centre and the International Union of Crystallography by Oosthoek's, Utrecht.

The success of the proposed system will depend on the response of the protein crystallographers supplying data. These will be accepted either "raw" or refined, in machine-readable form or as manuscripts. Laboratories intending to join the scheme should communicate with Mrs Olga Kennard or Dr D. G. Watson at the University Chemical Laboratories, Lensfield Road, Cambridge, who are responsible for the organization of the system. Data can be submitted to Cambridge or to Dr W. C. Hamilton at the Brookhaven National Laboratory, Upton, New York 11973, where the data will be computer processed.

The two centres will maintain identical files and both will provide data services. The new data bank is intended to supplement existing publication media so that depositing material in this form is not a substitute for the publication of the results of structural investigations in a scientific journal.

W. Wyckoff at the CSHL
meeting in 1971

Frances Bernstein

- 1974 began as programmer for CRYSNET
- Worked on annotation of more than 8000 PDB entries
- 1998 retired from BNL prior to RCSB PDB award

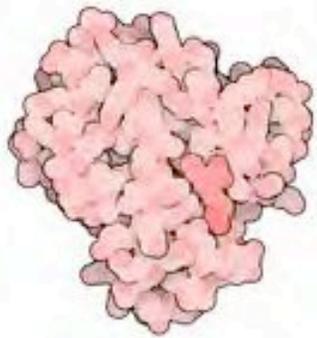

The CRYSNET consortium was funded by the NSF. Its goal was to allow distributed computing. In this case, Brookhaven provided high speed computing for calculating Fouriers and doing refinements. Remote sites could pick up the results via the (very young) internet.

Protein Data Bank

Newsletter

We thought it would be a good idea to mail out a report on the status of the Protein Data Bank and to establish at this time a regular newsletter. Some of the material in this first edition of the newsletter may be familiar to you. We promise that the next edition will be much smaller!

Deposition of Coordinates

Data may be deposited by filling out the form in Appendix 1. Tape or cards rather than a listing are appreciated. Mail these to

T.F. Koetzle
Department of Chemistry
Brookhaven National Laboratory
Upton, New York 11973
Telephone: 516-345-4384

Coordinate Directory

The coordinate sets in final distributable form are listed below along with coordinate sets soon to be available (marked *):

carboxypeptidase A
carp muscle calcium binding parvalbumin
 α -chymotrypsin
cytochrome b₅
flavodoxin *
D-glyceraldehyde-3-phosphate dehydrogenase *
horse hemoglobin (deoxy and met)
lactate dehydrogenase
lamprey hemoglobin
lysozyme *
myoglobin
pancreatic trypsin inhibitor
papain
rubredoxin
staphylococcal nuclease
subtilisin
thermolysin*

Format

The format of the coordinates is given in Appendix 2. Torsion angles, structure factors and phases are also available for some proteins, as indicated in Appendix 3.

Early PDB deposition procedures

November 30, 1981

Dr. Georg Schulz
Abteilung Biophysik
Max Planck Institut fuer
Medizinische Forschung
Jahnstrasse 29
6900 Heidelberg
West Germany

Dear Dr. Schulz:

Thank you for depositing the full coordinate set for glutathione reductase with the Protein Data Bank. We have extracted the data from the tape with no difficulty and will be processing it as soon as possible.

In the last three months we have received twenty coordinate sets (we usually get about thirty per year) and so we have fallen behind in our processing efforts. We are delighted to see this growth in the field and in our data base and hope that we will be able to get up-to-date soon.

With best wishes,

Sincerely,

Frances C. Bernstein

Three-Dimensional Coordinates from Stereodiagrams of Molecular Structures

BY MICHAEL G. ROSSMANN AND PATRICK ARGOS

Department of Biological Sciences, Purdue University, West Lafayette, Indiana 47907, USA

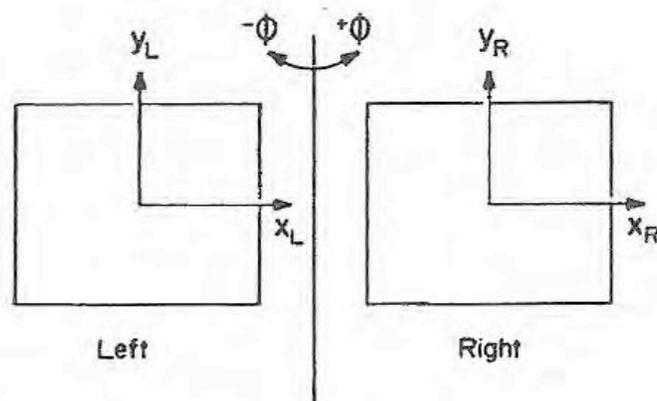

Fig. 1. Definition of coordinates in viewing a stereodigram. The z axis is perpendicular to the page.

where

$$x = \frac{x_L + x_R}{2 \cos \varphi} \times q,$$

$$y = \frac{y_L + y_R}{2} \times q,$$

$$z = \frac{x_L - x_R}{2 \sin \varphi} \times q,$$

$$q = \frac{1}{1 + \left(\frac{x_L - x_R}{2v \sin \varphi} \right)}.$$

The ethics question

The tradition of science is to gather and publish facts. Others may wish either to verify the facts by repeating the observations or to use these results to obtain a fundamental understanding of Nature in terms of a unifying concept or correlation. The accepted practice is to extract information from the literature, acknowledge its source, and to build upon it. The trend to withhold coordinates appears to be at odds with this long-standing tradition of scientific endeavor and exchange. Furthermore, coordinates are sometimes given only to close associates thus stifling a healthy public debate. Nevertheless, the present authors foresee that the technique published here may be considered a 'sharp' practice by some, although it is only extracting information from publications. This is evidenced by resistance to suggestions that coordinates be deposited with the Brookhaven Data Bank upon publication of high-resolution structures (*cf. Instructions to Authors of the Journal of Biological Chemistry*, 1979; *Crystallography of Molecular Biology*, 1976).

Publication and deposition of structural data

1976. Erice meeting recommendation by Michael Rossmann in book of abstracts: “A prerequisite for publication should be the deposition of coordinates at the Brookhaven Protein Data Bank”
- 1976(?) Martha Ludwig and Michael Rossmann, assistant editors of JBC, create compulsory deposition policy for JBC
1980. Extraction of co-ordinates from stereo diagrams.
1988. Janet Smith, chair of Gordon Conference, organizes public discussion
1988. More and more journals requiring deposition of coordinates
1990. NIH requires coordinate deposition for funding.
2008. PDB requires deposition of structure amplitudes with coordinates

Diversification of PDB archive

1989. First NMR data

1991. First EM data

Two thirds of all structures deposited with the PDB are based on Molecular Replacement in recent years, some based on *ab-initio* predicted structures.

Deposition of structural predictions?

How much experimental data should be required for inclusion in the PDB?

Problems of validation

PDB archive distribution

1971 Magnetic tapes, floppy discs **\$100**

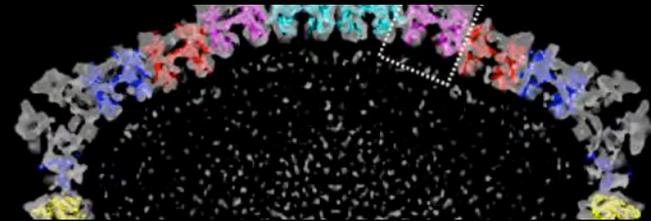

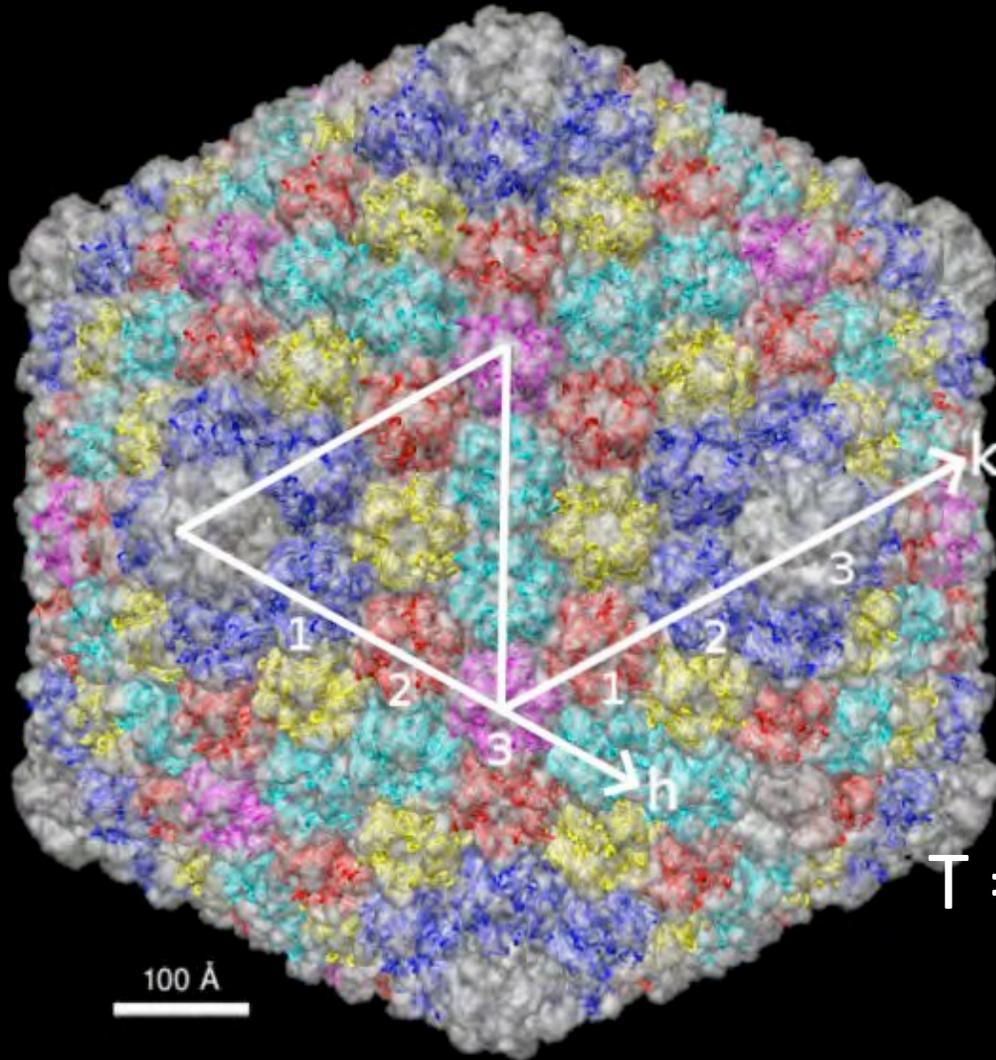

1992 CD-ROM discs **\$100**

1994 PDB Browser could read records in the header sections

1998 Distributions became **free** under the **Research Collaboratory for Structural Biology (RCSB)** PDB by giving yearly time-stamped snapshots of the archive, available at <ftp://snapshots.wwpdb.org/>.

2005 Last physical distribution
(In 2005 it took 8 DVDs for one distribution)
